## 15-112 Fall 2021 Quiz 4b

\* Up to 25 minutes. \* No calculators, no notes, no books, no computers. \* Show your work!

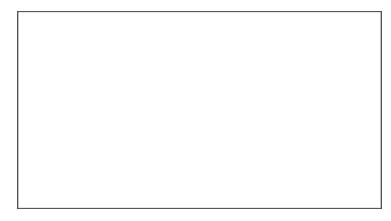

\* No recursion

Code Tracing 1 [20pts]: Indicate what the following code prints. Place your answers (and nothing else) in the box to the right of the code.

```
# Note: this prints 5 lines!
def ct1(L):
    M, N = L, L+[1]
    L[0] = 3
    N[2] = 4
    L += L
    for x in [L, M, N]:
        print(x)
L = [1,2]
print(ct1(L))
print(L)
```

Code Tracing 2 [20pts]: Indicate what the following code prints. Place your answers (and nothing else) in the box to the right of the code.

## Free Response 1: nondestructiveMoveEvensToEnd [35 pts]

Write the function nondestructiveMoveEvensToEnd(L) that takes a possibly-empty list of integers L and nondestructively returns a new list with all the odds in L first, in the same order they appear in L, followed by all the evens in L, again in the same order they appear in L. So:

```
L = [1,2,3,4,5]:
assert(nondestructiveMoveEvensToEnd(L) == [1,3,5,2,4])
assert(L == [1,2,3,4,5]) #L does not change:
```

For full credit, your solution may not call the destructive version (destructiveMoveEvensToEnd) or apply very similar logic on a copy of L

## Free Response 2: destructiveMoveEvensToEnd [35 pts]

Write the function destructiveMoveEvensToEnd(L) that takes a possibly-empty list of integers L and destructively modifies L so that all the odds in L are first, in the same order they appear in the original list, followed by all the evens in the original list, again in the same order they appear in L. Your function should return None. So:

```
L = [1,2,3,4,5]
assert(destructiveMoveEvensToEnd(L) == None)
assert(L == [1,3,5,2,4])
```

## **Bonus/Optional: Code Tracing [+2.5pts]**

Indicate what this prints. Place your answer (and nothing else) in the box.

```
def bonusCt(L, M):
    while L != M:
        L,M = M,L
        M.append(L.pop(0))
        M.pop(0)
        L[-1] = sum(M)
    return L
print(bonusCt([1,2,3],[4,5,6]))
```
